Ρ

Parameter key

Adjustment of chosen parameter (e.g. setpoint) to higher or lower values. E.g. setpoin adjustment. Short operation: single-step adjustment Longer operation: quick-scanning When the parameter adjustments have been altered but not entered, the display will flash bright/dark.

Ε

Confirmation and storage of the pre-selected values The display will shortly show a light chain as a control of this function. To return to the process- and setpoint-display: press "E" appr. 2 sec..

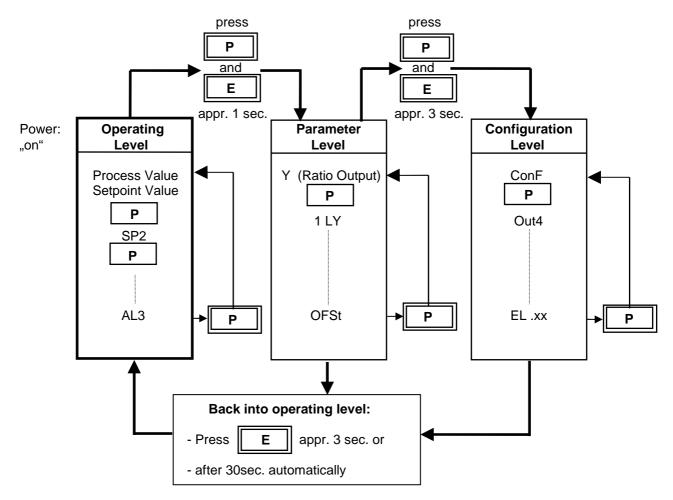

Ρ

Sets the parameter back to the originally stored value. Any alterations made to the parameters, that are not confirmed (E-key) within 30 seconds, will not be accepted and the parameter will return to ist originally stored value.

Operating Levels

The operation of the controller is divided into three levels.

Two seconds after switching on the unit, the controller will automatically be in the operating level.

Operating level

Process- and setpoint value will be displayed simultaneously. Within the operating level the setpoints and the alarm value can be adjusted by pressing the "_____" / "___" - keys. Every adjustment has to be quit by pressing the ", E " - key.

All parameters within the operating level can , in succession, be displayed by pressing the ", P " - key and adjusted by pressing the ", ", ", ", ", keys.

Parameter level

Enter this level by pressing the " P " and " E "-key appr. 1 sec. simultaneously. Within the parameter level the values are adjusted to suit the control behaviour to the individual process. Leave this level by pressing key " E " appr. 3 sec..

Configuration level

Enter this level by pressing the " P " and " E "-key appr. 3 sec. simultaneously.

In the configuration level the controller type, sensor type, the sensor range, the alarm behaviour and the output type can be pre-selected.

This primary information has to be entered before taking the controller into operation.

The display of each single parameter within the parameter and configuration levels, and their adjustment, are made in the same way as within the operating level.

After either pressing the **"E**" - key for approx. 3 seconds, or waiting for a period of approx. 30 seconds, the unit will automatically return to the operating level (display of process value and setpoint).

		0-20	Current-Input Voltage-Input	0-20mA <u>or</u> 0-10VDC (only option: 01)
		4-20	Current-Input	4-20mA

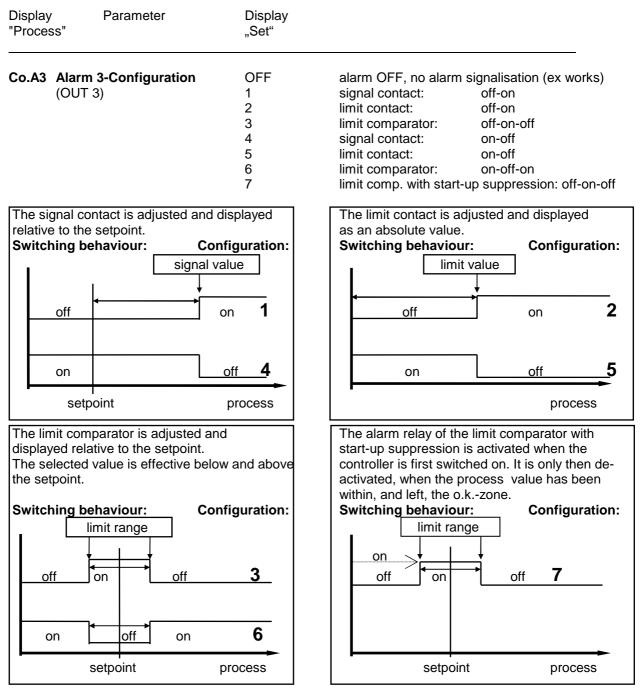

If the Sensor selection is changed, the following parameters will be reset (setting in brackets) and need to be re-adjusted:

All Setpoints (set to OFF); ; alarm values (OFF); control sensivity (0);

process offset(OFF); lower setpoint limitation (SP.Lo); higher setpoint limitation (SP.Hi).

The following parameters are only valid for standard signal inputs (0...20mA, 4...20mA). The difference between the bottom end of the display range and the top end must amount to a minimum of 100 units and a maximum of 2000 units. By adjustment of one of the above parameters, the other in this case will automatically follow.

rA.SP rA.Hi rA.Lo	decimal points display range top end display range bottom end	0; 1; 2 rA.Lo 9999 -1999 rA.Hi	(ex works: 1) (ex works: 100,0) (ex works: 0,0)

SP.Lo	lower setpoint limitation	bottom range SP.Hi	(ex works: 0)

on: Relay "activated" or bistable voltage output "high". off: Relay "not active" or bistable voltage output "low".

If a setpoint ramp has been programmed, the alarms that are relative to the setpoint (signal contact, limit comparator) follow the setpoint up the ramp.

Please note:

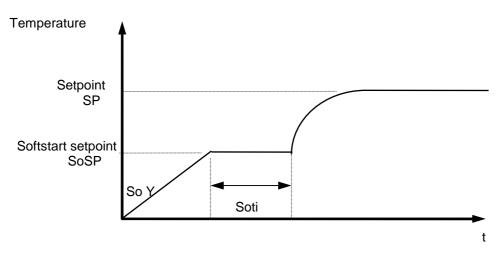

In case of sensor error the alarms will react in the same way as range override. The alarm contacts therefore do not offer protection against all types of plant breakdown. With this in mind, we recommend the use of a second, independent monitor unit.

Co.A2 Alarm 2-Configuration see Co.A3 (alarm 3 - configuration) (switches OUT 2)

Display	Parameter	Display
"Process"		"Set"

Only for 2-point- (heat-only) , 3-point-(heating mode) and continuous- (heating) controller configurations:

Softstart (general function):

During the softstart the controllers' output response is limited to a pre-selected ratio, in order to achieve a slow baking out of high performance heat cartridges. Simultaneously the output clock frequency is quadrupled. Once the process value reaches the softstart setpoint, it remains stable at this value for a pre-selected hold-duration time. At the end of this period the process value rises to the valid setpoint. This results in a slower, more regular heating period.

For this purpose the bistable voltage output must be chosen, that actuates SSR relays.

If the softstart is active, the controllers' autotune function can't operated (Er.OP). If a setpoint-ramp has been programmed, the softstart has priority, and the ramp will only become active after the softstart has been completed.

The softstart only works, if the parameter ",1 P" (prop. band) is programmed > 0,1%. During the softstart-phase it is not possible to change the setpoint values. For this, the softstart-phase has to be stopped.

So. Y	Softstart output ratio	OFF: Softstart not active 10 100%	(ex works)
So.SP	Softstart setpoint	range: SP.Lo SP.Hi	(ex works: 0)
So.ti	Softstart duration time	OFF; 0,1 9,9 min.	(ex works: OFF)

Hand manual output ratio OFF Auto Man (ex works) Setting: OFF not active Setting: OFF not active Setting: Auto Man Setting: Auto Multiput ratio as the actuating signal. An "H" is then displayed as the first digit in the setpoint display, followed by the valid output ratio. This ratio can be manually altered in steps of 1% (up/down-keys; enter). Under the following circumstances, the output ratio will be 0%: • if the output ratio at time of the sensor break was 100%. • if the control deviation was more than 0,25% of the total range at the time of sensor break. • if the soft start was active at the time of the sensor break. • if the soft start was active at the time of the sensor break. • if the soft start was active at the time of the sensor break. • if the soft start was active at the time of the sensor break, the controller returns to automatic operation and calculates the required output ratio. • and ditional signal can be issued in the event of sensor break, if the alarm contacts are programmed accordingly. Exting: MAN The controller now operates only as an actuator. Within the operation level, an output ratio can be entered instead of the sensor break the first digit in the setspoint. An "H" is then displayed as the first digit in the setspoint. An "H" is the output ratio.	Display "Process"	Parameter	Display "Set"
	Hand	manual output ratio	Auto Man <u>Setting: OFF</u> not active <u>Setting: Auto</u> In event of sensor break the controller automatically maintains the last valid output ratio as the actuating signal. An "H" is then displayed as the first digit in the setpoint display, followed by the valid output ratio. This ratio can be manually altered in steps of 1% (up/down-keys; enter). Under the following circumstances, the output ratio will be 0%: - if the output ratio at time of the sensor break was 100%. - if the control deviation was more than 0,25% of the total range at the time of sensor break. - if the prop.band (P; xp) = 0. - if the soft start was active at the time of the sensor break. A few seconds after the sensor break has been rectified, the controller returns to automatic operation and calculates the required output ratio. An additional signal can be issued in the event of sensor break, if the alarm contacts are programmed accordingly. <u>Setting: MAn</u> The controller now operates only as an actuator. Within the operation level, an output ratio can be entered instead of the setpoint. An "H" is then displayed as the first digit in the set- point display, followed by the output ratio. - : cooling output ratio.

1 Sd control sensitivity heating OUT1 or OUT4 Only if 1 P = OFF :

The following parameters apply only to the configuration of heating-off-cooling (3-point) controllers:			
Sh	switch-point difference	OFF; 0,180,0 °K (ex works: OFF) OFF; 0,018,00 °K This parameter raises the setpoint (switch-point) for cooling output by the displayed value. It can be help to reduce the switching frequency between the heating and cooling outputs, if this is to high. Simultaneously activation of heat and cool outputs is not possible.	
2 P	OUT2 / OUT4- cooling propband (P)	OFF; 0,1100,0 % if Xp = OFF, the next parameter to follow is "2 Sd" =	(ex works: 6,0) control sensitivity OUT 2
2 d	OUT2 / OUT4 - cooling rate (D)	OFF; 1200 secs	(ex works: 150)
2 J	OUT2 / OUT4 - cooling reset (I)	OFF; 11000 secs	(ex works: 15,0)
2 CY	OUT2 / OUT4 - cooling cycle time	0,5240,0 secs	(ex works: 10,0)
	2 P = OFF : control sensitivity cooling	OFF; 0,180,0 °K OFF; 0,018,00 °K	(ex works: OFF)

Opt self tuning

see next pages please

(ex works: 0,1)

Display "Proce		Display "Set"	/
OPt	self tuning (autotune)	OFF on Auto	self tuning out of action self tuning on request (one time) self tuning automatically if the controller is switched on and if the difference between process value and setpoint is > 7 % of the range.

The tuning algorithm determines the characteristic values within the controlled process, and calculates the valid feedback parameters (P,D,I) and the cycle time ($C = 0.3 \times D$) of a PD/I-controller for a wide section of the range.

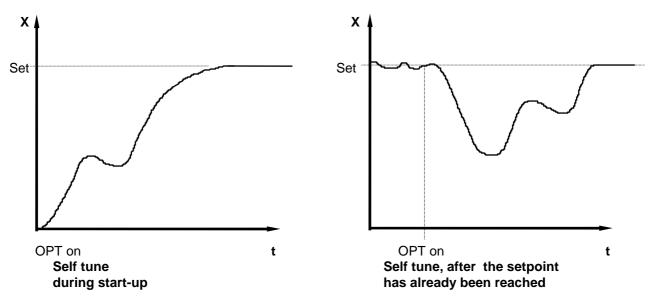

The determined parameters for heating are also adopted for cooling.

The self tuning activates during start-up shortly before the setpoint is reached. The setpoint must amount to the least 5% of the total range.

If activated after the setpoint has already been reached, the temperature will first drop by approx. 5% of the total range, in order to detect the exact amplification of the process.

The tuning algorithm can be activated at any time by selecting the OPT=on and pressing the "E"-key. During self tuning "Opt" is shown in the display, alternating with the setpoint value. Using the heat-cool controller, the temperature drop will be accelerated by switching on the cooling for a short duration.

After having calculated the correct feedback parameters, the controller will lead the process value to the setpoint.

Self-tuning can be stopped by selecting the option OPT = OFF and pressing the "E" - key.

OFSt	process value offset	-999 OFF1000 °K	(ex works: OFF)
		-99,9 OFF 100,0 °K	
	This parameter serves to co	prrect the input signal, e.g. for:	

- the correction of a gradient between the measuring point and the sensor tip,

- the line resistance balancing of 2-line RTD (Pt100) sensors and
- correction of the control devition when using P- or PD-action.

If for example the offset value is set to +5°C, then the real temperature measured by the sensor (when process is balanced) is 5°C less than the setpoint and the displayed process value.

Operating Level

Parameter Display "Set" Display "Process" Process (process) and Setpoint 1 OFF, SP.Lo...SP.Hi (ex works: 0) (set) are displayed simultaneously (basic setting). If setpoint 1 (SP1) is set to "OFF", the controller switches to stand-by. The setpoint display then shows "OFF". All main outputs are switched off and the alarm is de-activated. All parameters can be displayed and altered during stand-by. SP2 Setpoint 2 OFF; SP.Lo SP.Hi (ex works: OFF) The 2. setpoint is active when the external contact K1 is closed. The corresponding LED "SP2" lights up on the faceplate, and the second set-point is shown in the display." Please note, that the value of the second setpoint cannot be changed in the oprating level. In order to change the value the parameter SP2 has to be selected.

AL 3 Alarm 3, Out3 signal contact, setp		signal contact, setpoin	it dependent	
		OFF; -9991000	°K	(ex works)
		OFF; -99,9100,0	°K	
		limit comparator, setpe	oint dependent	
		OFF; 11000	°K	(ex works)
		OFF; 0,1100,0	°K	
		limit contact, process of OFF; range bottom	•	
			range top	

The range of adjustment is dependant on the sensor and the alarm configuration. Both have to be set in the configuration level.

AL 2	Alarm 2, Out2	for adjustments see "Alarm 3"
		Alarm 2 is only available, if the controller is programmed
		as a 2-point- or a continuous-controller in the configuration- level.

Error displays

Display	Cause	Possible remedy
SP.Lo	Lower setpoint limit has been reached	Reduce limit, if need be
SP.Hi	Upper setpoint limit has been reached	Increase limit, if need be
LOC	Parameter has been locked	Unlock, if need be
Hand	Instrument operates in manual mode Automatically switch over because of a sensor error (if this is programmed).	Check sensor and cable
Er.Hi	Top range end has been exceeded, sensor defect	Check sensor and cable
Er.Lo	Bottom range end has been exceeded, sensor defect	Check sensor and cable
Er.OP	Self tuning error	Extinguish error signal by pressing the "E"-key. Check the self tuning conditions and restart.
Er.SY	System error	Extinguish error signal by pressing the "E"-key. Check all parameters. If the error signal continues please send the controller back for examination.

Installation Instructions

Make certain that the devices described here are used only for the intended purpose. They are intended for installation in control panels.

The controller must be installed so that it is protected against impermissible humidity and severe contamination. In addition, make sure that the permitted ambient temperature is not exceeded.

The electrical connections must be made according to the relevant locally applicable regulations.

If using a thermocouple sensor, the compensation cables must be laid directly to the controller terminals.

Transducers must be connected only in compliance with the programmed range.

Transducer cables and signal lines (e.g. logic or linear voltage outputs) must be laid physically

separated from control lines and mains voltage supply cables (power cables).

To keep the CE-conformity it is nessesary, to use for sensor- and low voltage signal lines shielded cabels.

Spatial separation between controller and inductive loads is recommneded.

Interference from contactor coils must be suppressed by connecting adapted RC-combinations parallel to the coils. Control circuits (e.g. for contactors) should not be connected to the mains power supply terminals of the controller. **IMPORTANT:**

Before operation, the unit must be configurated for its intended purpose

(e.g. controller type, sensor type and range, alarm adjustment etc.). Please see "Configuration Level".

Disclaimer of liability

We have checked the contents of the document for conformity with the hardware and software described. Nevertheless, we are unable to preclude the possibility of deviations so that we are unable to assume warranty for full compliance. The information given in the publication is, however, reviewed regularly. Necessary amendments are incorporated in the following editions. We would be pleased to receive any improvement proposals which you may have.
